

The image shows a dried botanical specimen of Halodule uninervis, a seagrass. The specimen is laid out on a white background. It consists of several reddish-brown, fibrous stems that are interconnected. From these stems, several long, thin, blade-like leaves extend outwards. The leaves are a yellowish-brown color, indicating they have been dried. The base of the stems shows some root-like structures. The overall appearance is that of a delicate, branching underwater plant.

Specimen #: NFC339

Species: *Halodule uninervis* - wide

Collector: Len McKenzie 30/07/1997

Location: Port Douglas, Low Isles, site 1159

Lat: 16° 22.96' S **Long:** 145° 33.8' E

Depth: 4m **Sediment:** Sand **% cover:** 10

Other species: *Halophila ovalis*

Flowers: 0 **Fruit:** 0
